

Energize your Asset Performance

Think differently about Enterprise Asset Management and uncover the 80% of value not addressed by conventional EAM solutions.

Are you missing the single biggest cost element in managing your assets?

Taking your enterprise asset management to the next level may seem a little like squeezing water out of a stone. Chances are you have a solution in place that tells you what assets you need, when to perform maintenance, and when to replace assets. But, in today's economic climate with rising oil prices, weakening currency, and growing regulatory pressure, you're finding that's not enough. Your business needs to squeeze more business value out of your existing assets. You're just not sure how.

The time is right to think differently about enterprise asset management. The time is right to view your asset management strategy through a new lens—the energy your assets consume, the emissions your operation produces, and the impact both have on your bottom line. *Consider the following:*

- Do you know the true energy cost of your individual assets?
- Can you tell when the energy efficiency of an asset degrades, leading to unnecessary costs?
- Can you factor energy efficiency into the preventative maintenance plan for individual assets?
- What effect do your assets have on the environment?
And, are you in compliance?
- Do you know the ideal time to replace an asset based on its energy consumption as well as its life expectancy?
- When it's time to replace an asset, can you evaluate alternative vendor equipment based on energy efficiency as well other traditional metrics?

Infor can energize your asset performance

At Infor, we've asked ourselves the same questions. And we've come up with a solution that can help you answer each individual question, as well as the broader question: "How can I take my enterprise asset management to the next level?"

Infor EAM Asset Sustainability Edition is not a typical enterprise asset management solution. Yes, it does all the things you expect from an advanced EAM solution—improve the efficiency of maintenance processes, increase equipment uptime, right-size your asset infrastructure, and more. But with Infor EAM Asset Sustainability Edition, you integrate energy management with asset management and, in the process, come up with the information you need to capture the hidden value in your assets. The solution can help you:

- Track energy consumption details for individual assets
- Determine the financial impact of energy and natural resource consumption
- Perform preventative maintenance and alerting based on equipment status and energy efficiency
- Configure your asset infrastructure to reduce the consumption of energy and natural resources, and reduce emissions of greenhouse gases and pollutants
- Identify the most energy-efficient vendor products and equipment and evaluate them against the energy efficiency of your installed operating asset base to help increase the sustainability of your operations.
