

Infor System21 Aurora Location Control

Do business better.

Companies today struggle to efficiently monitor and accurately control inventory transactions by location, without contending with the overhead associated with introducing a full warehouse management system. For these companies, the answer is Infor System21 Aurora Location Control.

Leverage experience.

Infor™ has more than 25 years of experience helping companies meet their toughest challenges—experience that we build in to our solutions. As you grow, our solutions help you balance the often conflicting goals of maximizing customer service and minimizing cost. Location Control extends Infor System21 Aurora Inventory Control to deliver a comprehensive range of tools for recording and processing inventory activities by location.

Get business specific.

Infor System21 Aurora Location Control extends through all processes where production transactions interface with inventory. You monitor and control inventory transactions by location without the overhead associated with a full warehouse management application. It includes:

Locations.

These are simply sub-divisions of an inventory stockroom. They can be "in-use" or "suspended," with no capacity or proximity limitations. They are efficiently created in ranges. Location Control is applied at the stockroom level, but can be used alongside stockrooms that need more rigorous controls, using System21 Aurora Warehouse Management.

Infor System21 Aurora Location Control extends the use of Inventory Control and all related operational transactions to control and monitor movement and storage of material by location.

Location balances.

Maintains physical and frozen balances by location, and secondary balances when catchweights are used. A single transaction can be spread over several locations.

Stock rotation.

Our solution fully supports stock rotation for lot, batch, and serial controlled items. You also have the option to set the stock rotation date as the last date on which the lot is available.

Location selection.

Monitor issues easily—the solution only displays the location with stock for the item along with current balances. For receipts, empty locations are displayed as well as the default location and all other locations holding stock for the item—both with current balances.

Consignment stock.

Location control is used as the basis to provide a handy control/re-supply/invoicing mechanism for stock held at a customer location.

Integration.

All issues and receipts to stockrooms can hold location information, including sales and purchase management, customer returns, and production. Locations are printed on pick notes. Stocktaking is supported by range of locations, range of items, or by ABC class.

Enquiries.

A location balance enquiry by item is provided and is available through the item/stockroom enquiry, as well as a location enquiry.

See results now.

Infor System21 Aurora Location Control helps balance the often conflicting goals of maximizing customer service and minimizing costs. You gain:

- Optimized logistics performance
- Comprehensive support for effective and efficient customer service
- Rapid ROI

Developed for a supply chain that truly competes in today's demanding global marketplace, our solution helps ensure your goods are always in the right place at the right time.
